## Third International Olympiad, 1961

1961/1.
Solve the system of equations:

$$
\begin{aligned}
x+y+z & =a \\
x^{2}+y^{2}+z^{2} & =b^{2} \\
x y & =z^{2}
\end{aligned}
$$

where $a$ and $b$ are constants. Give the conditions that $a$ and $b$ must satisfy so that $x, y, z$ (the solutions of the system) are distinct positive numbers.

1961/2.
Let $a, b, c$ be the sides of a triangle, and $T$ its area. Prove: $a^{2}+b^{2}+c^{2} \geq 4 \sqrt{3} T$. In what case does equality hold?

## 1961/3.

Solve the equation $\cos ^{n} x-\sin ^{n} x=1$, where $n$ is a natural number.
1961/4.
Consider triangle $P_{1} P_{2} P_{3}$ and a point $P$ within the triangle. Lines $P_{1} P, P_{2} P, P_{3} P$ intersect the opposite sides in points $Q_{1}, Q_{2}, Q_{3}$ respectively. Prove that, of the numbers

$$
\frac{P_{1} P}{P Q_{1}}, \frac{P_{2} P}{P Q_{2}}, \frac{P_{3} P}{P Q_{3}}
$$

at least one is $\leq 2$ and at least one is $\geq 2$.
1961/5.
Construct triangle $A B C$ if $A C=b, A B=c$ and $\angle A M B=\omega$, where $M$ is the midpoint of segment $B C$ and $\omega<90^{\circ}$. Prove that a solution exists if and only if

$$
b \tan \frac{\omega}{2} \leq c<b
$$

In what case does the equality hold?

## 1961/6.

Consider a plane $\varepsilon$ and three non-collinear points $A, B, C$ on the same side of $\varepsilon$; suppose the plane determined by these three points is not parallel to $\varepsilon$. In plane a take three arbitrary points $A^{\prime}, B^{\prime}, C^{\prime}$. Let $L, M, N$ be the midpoints of segments $A A^{\prime}, B B^{\prime}, C C^{\prime}$; let $G$ be the centroid of triangle $L M N$. (We will not consider positions of the points $A^{\prime}, B^{\prime}, C^{\prime}$ such that the points $L, M, N$ do not form a triangle.) What is the locus of point $G$ as $A^{\prime}, B^{\prime}, C^{\prime}$ range independently over the plane $\varepsilon$ ?
